

# Linux and git

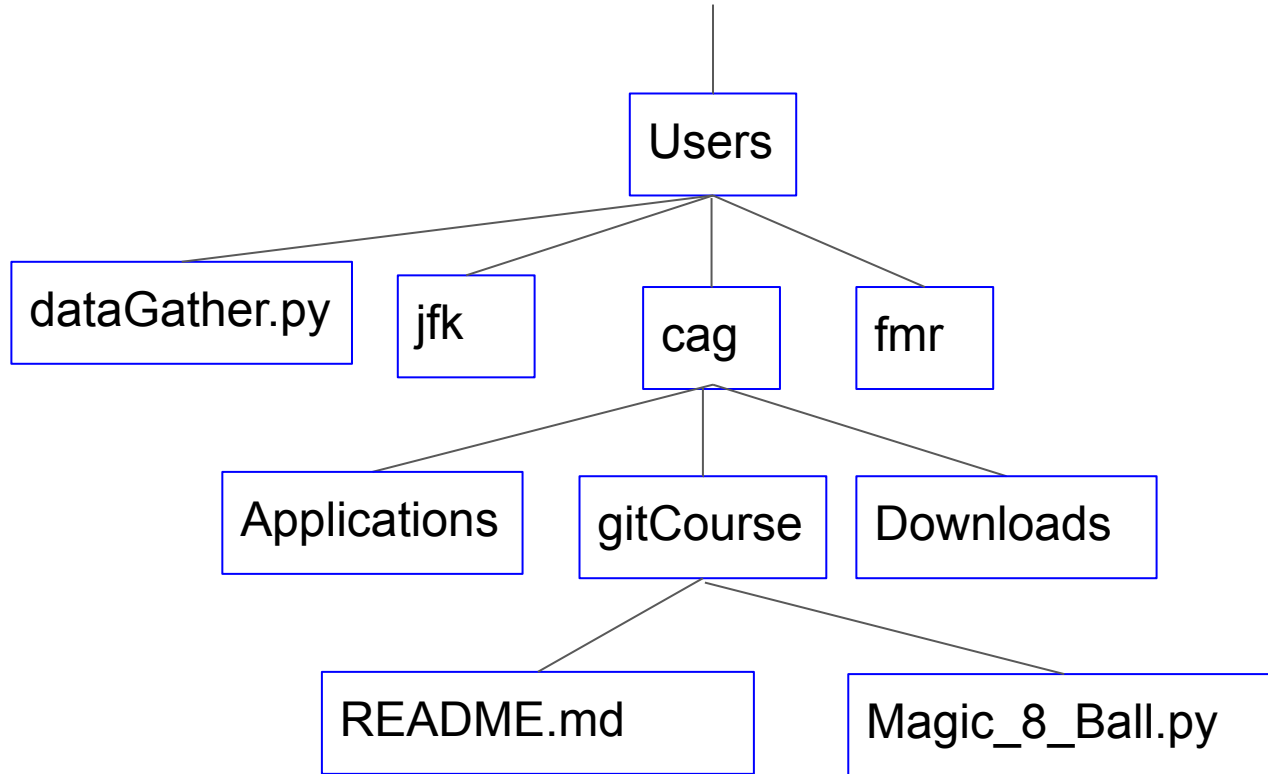

git for Field Technicians

# Goals

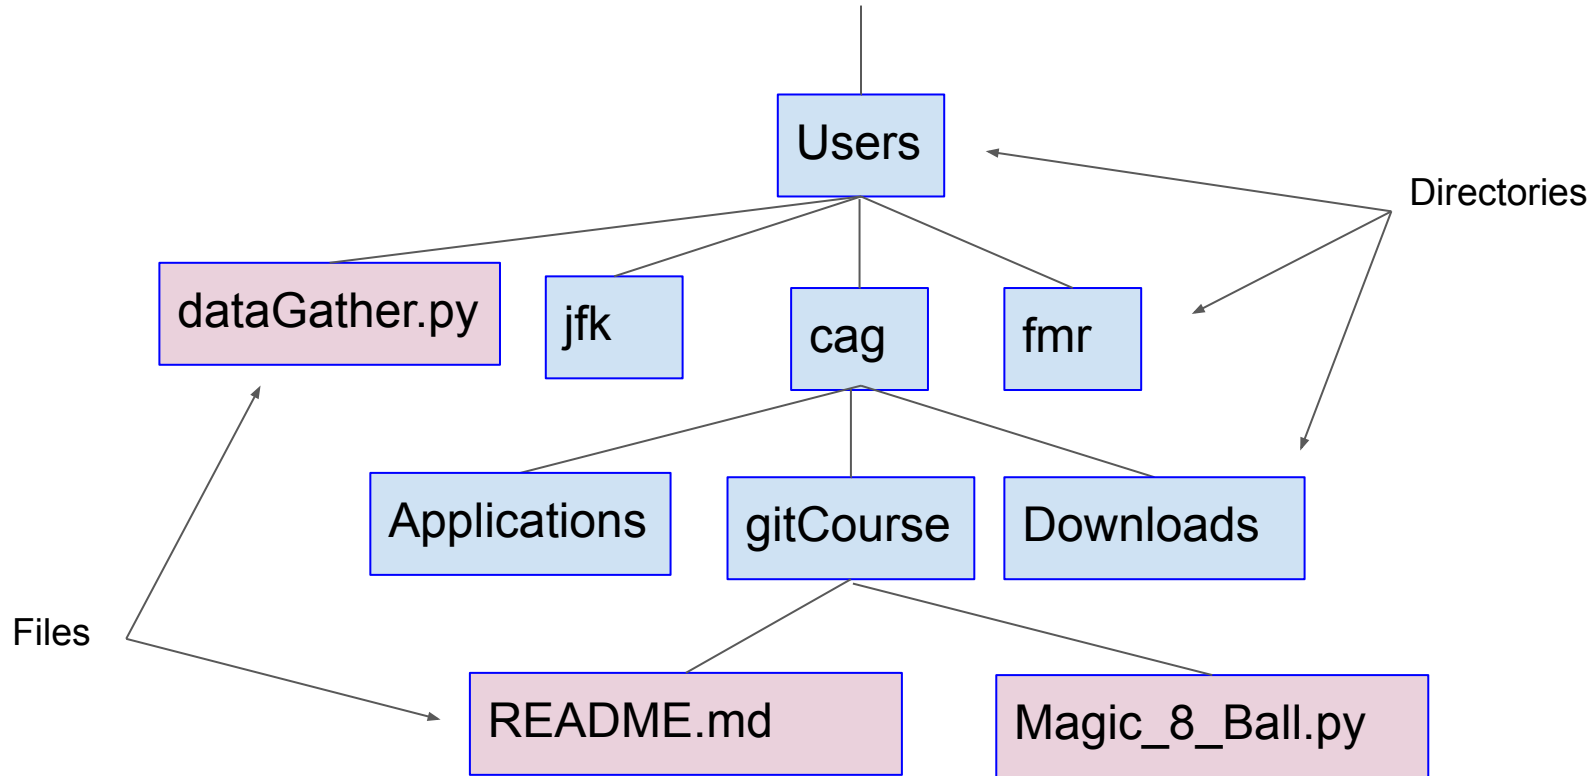

1. Check the status of the code on your computer
2. Check out, fetch, and pull your repository
3. Clone a git repository
4. Create a directory

# Introduction to Linux

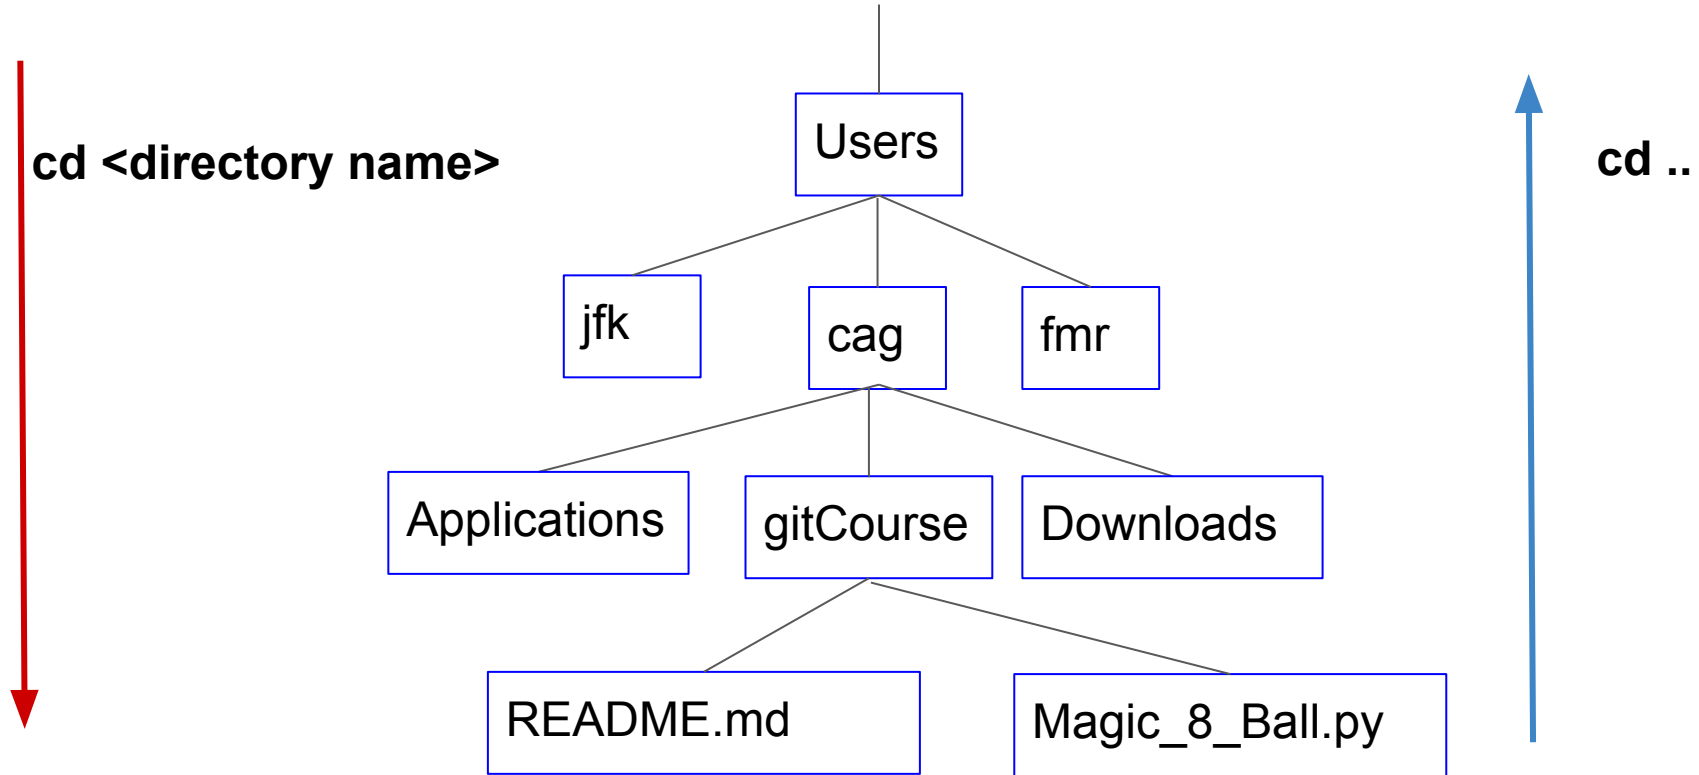

# Linux is structured like a tree

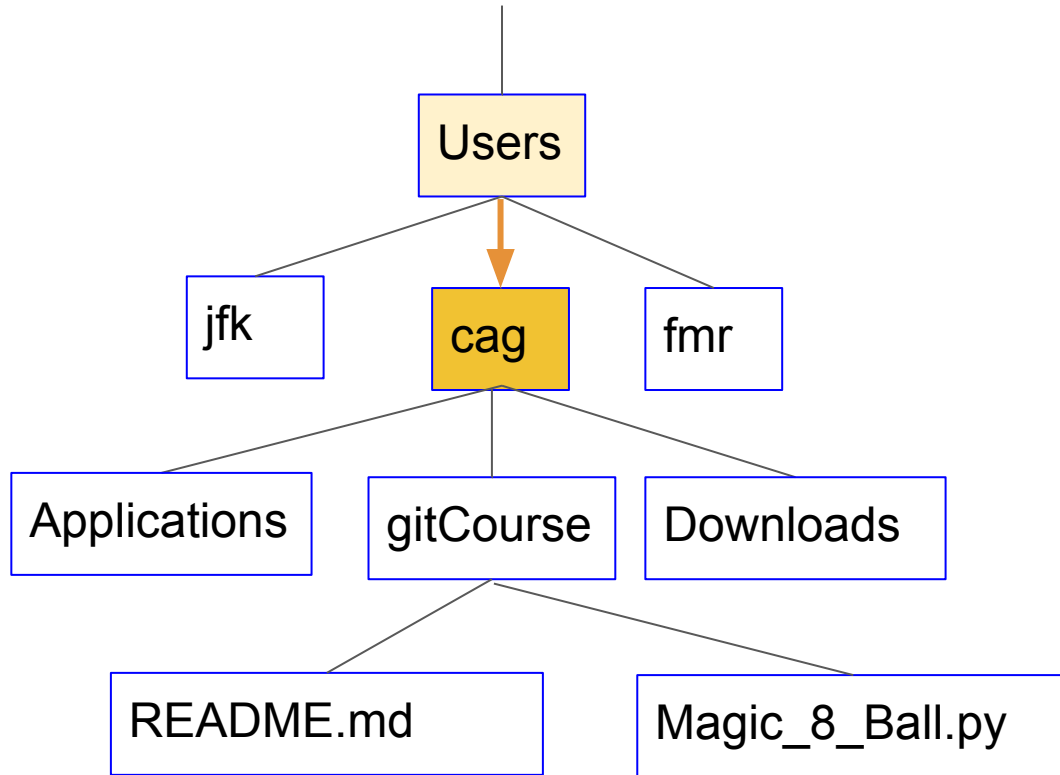

# Directories can contain files and directories

Use the command **cd** to travel up and down the tree

# Traversing down the tree

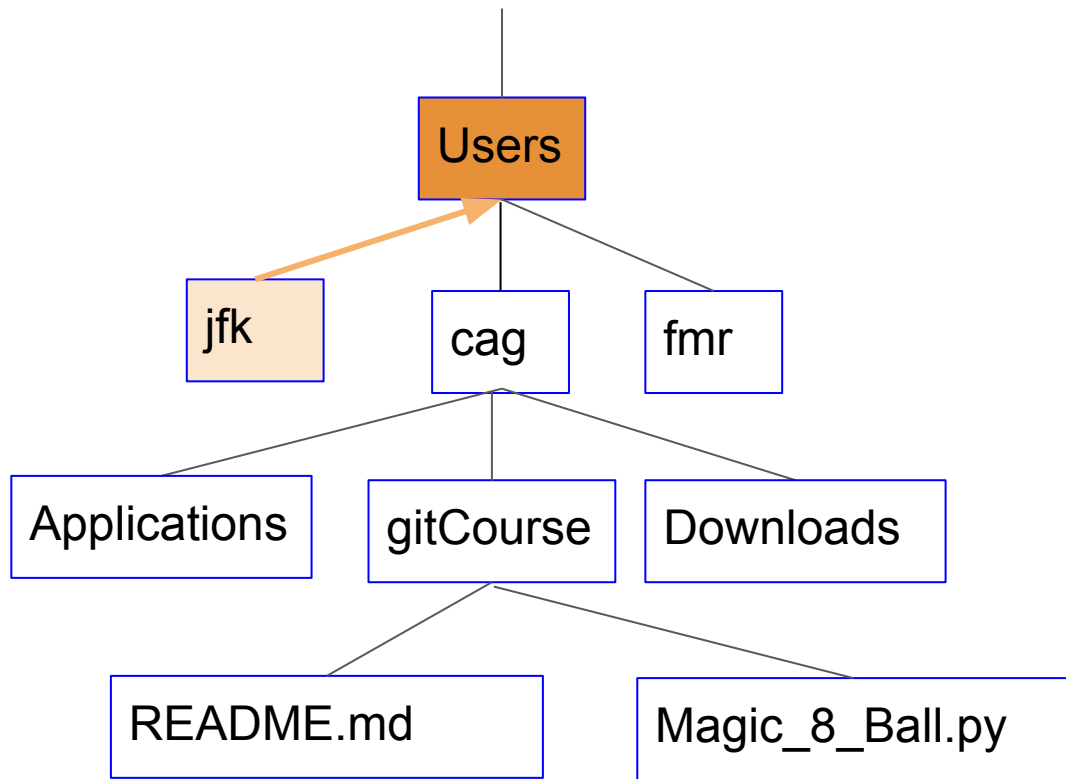

You are in the **Users** directory and you would like to go to the **cag** directory

`cd <directory name>`

**`cd cag`**

# Traversing up the tree

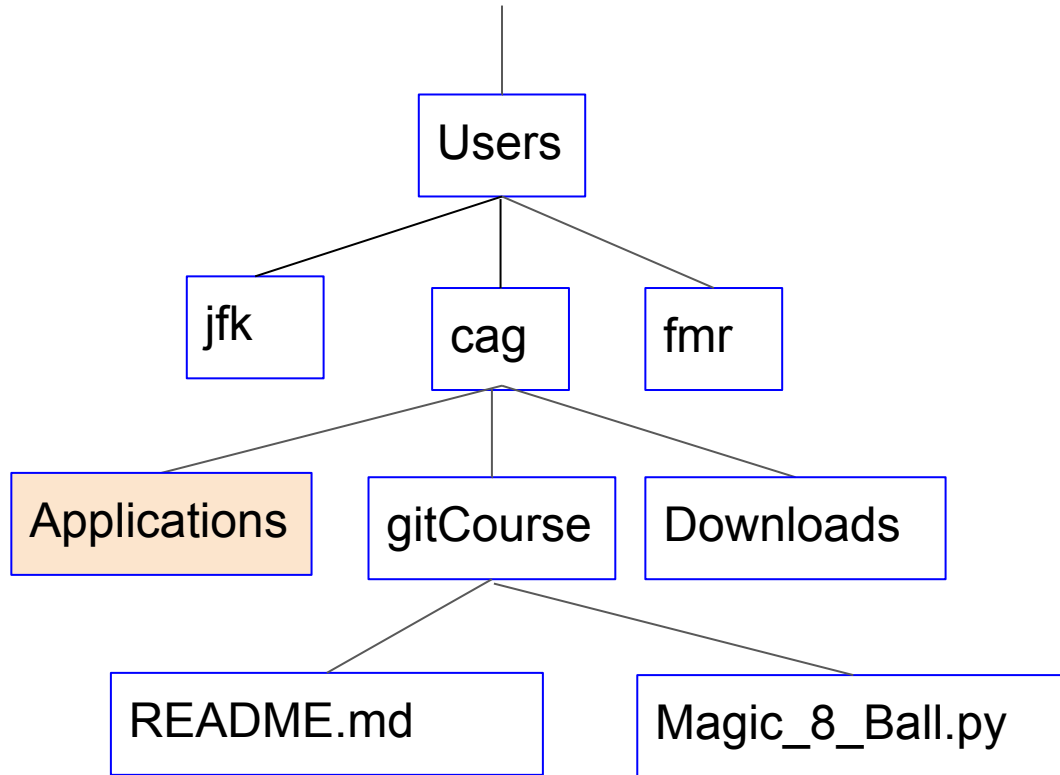

You are in the **jfk** directory and you would like to go to the **Users** directory

**cd ..**

# Finding your location in the tree

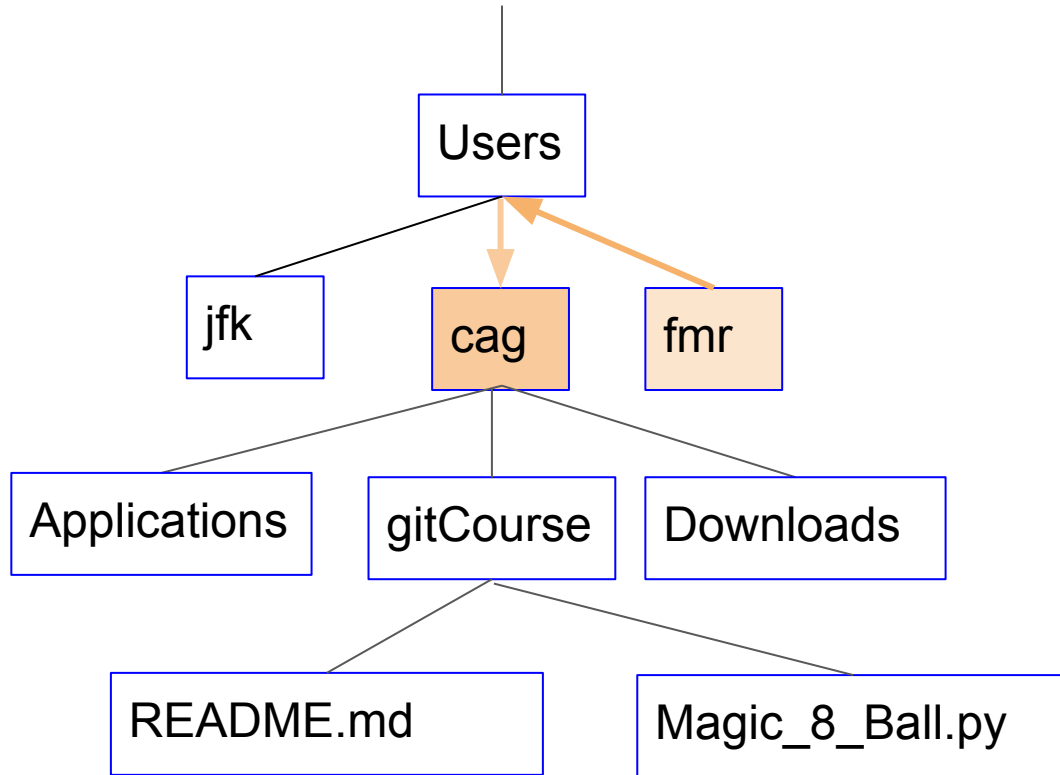

You are working in Linux and you want to know in which directory you are working.

**pwd**

The name of the directory you are in is printed.

# Going home

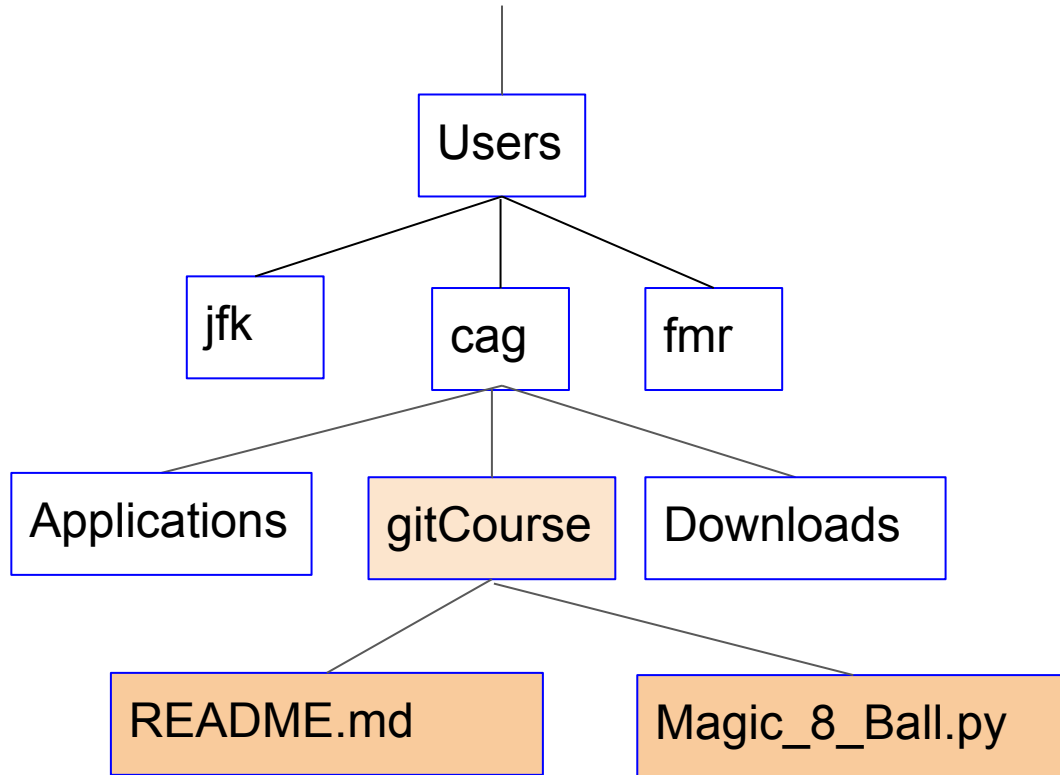

You are working in Linux  
and you want to go to  
your home directory

**cd ~**

You will return to your  
home directory

# Listing directory contents

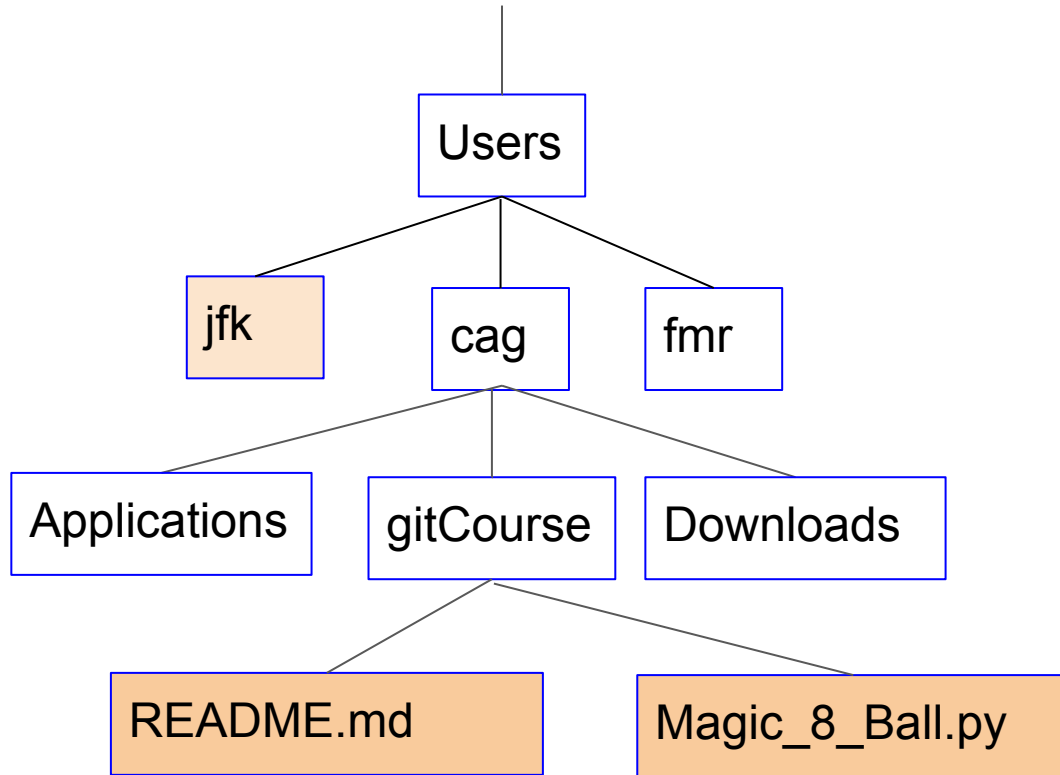

You are working in the gitCourse directory and you want to know what is in the directory.

**ls**

The contents of gitCourse will be printed

# Listing another directory's contents

You are working in the **jfk** directory and you want to know what is in the gitCourse directory.

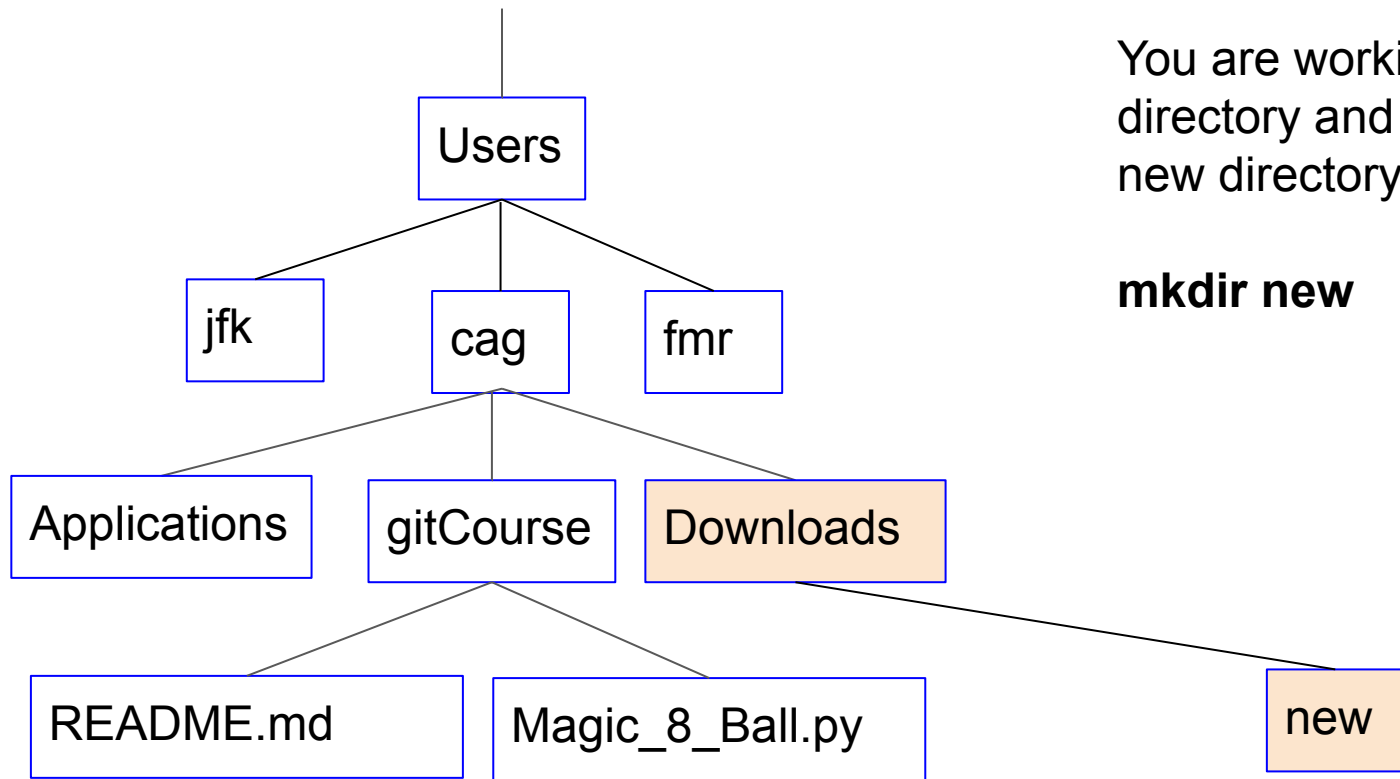

**Is ~catherine.gamboa/gitCourse**

The contents of gitCourse will be printed

# Make a new directory

You are working in the **Downloads** directory and you want to create a new directory called new

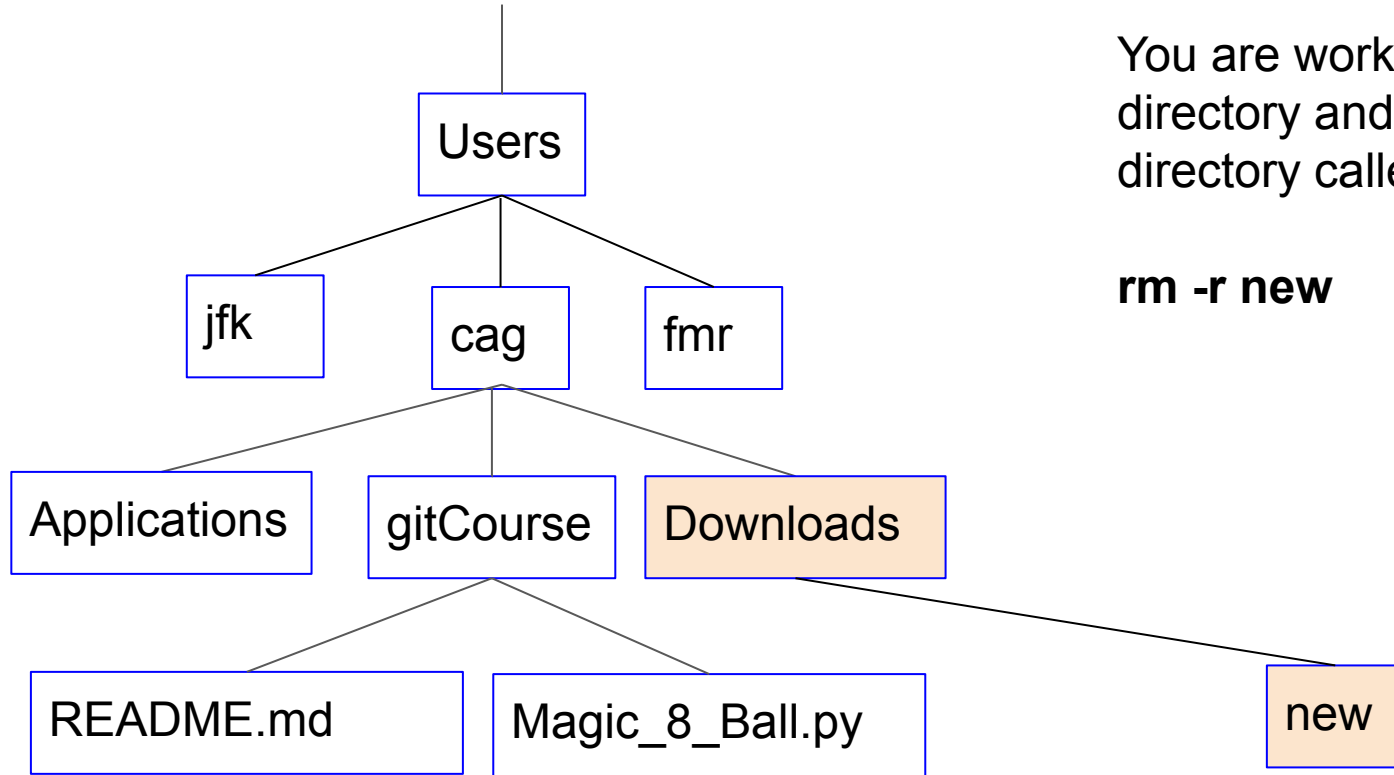

**mkdir new**

# Delete a directory

You are working in the **Downloads** directory and you want to delete a directory called new

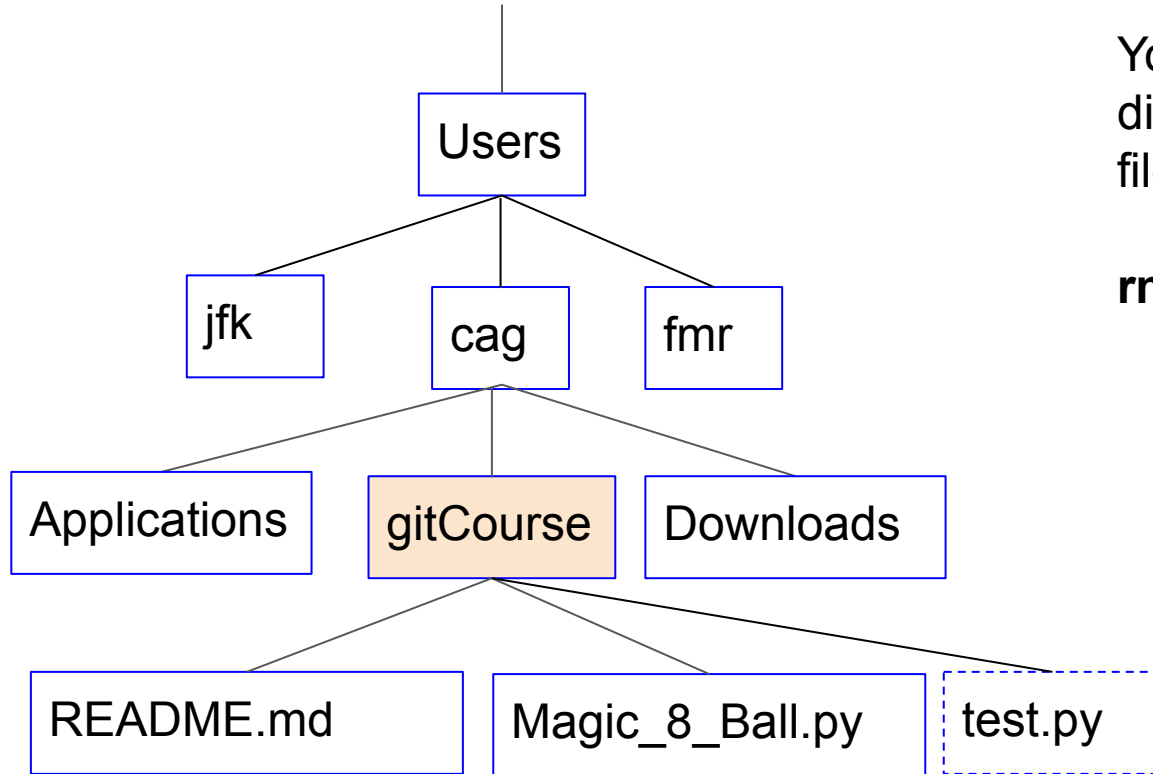

**rm -r new**

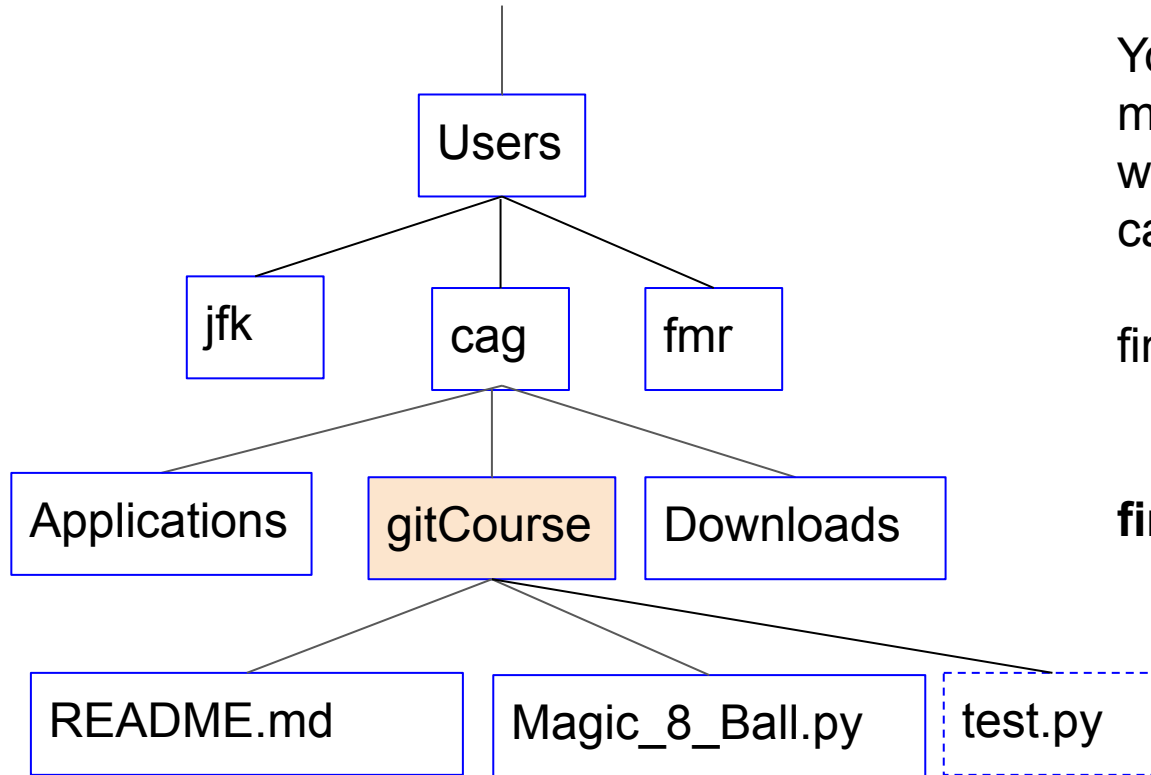

# Delete a file

You are working in the **gitCourse** directory and you want to delete a file called test.py

**rm test.py**

# Find a file or directory

You are working on your Linux machine. You can't remember which directory contains your file called `Magic_8_Ball.py`

`find ~/*/<file or directory name>`

**`find ~/*/Magic_8_Ball.py`**

# Lab

## The Linux Environment

# Lab: The Linux environment

In this lab you:

Check for the presence of the correct directory

Make the directory if it is not present

# Open a terminal window

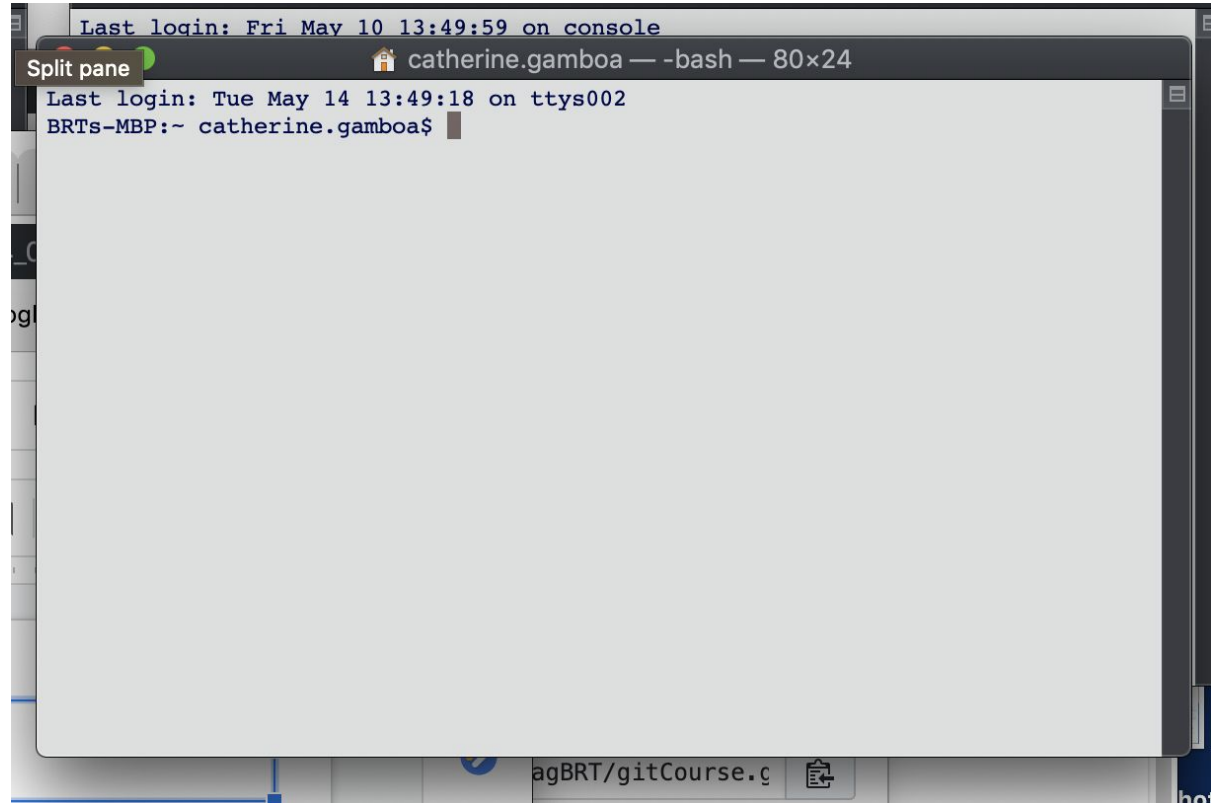

You can open a terminal window using any method you choose.

If you like, use the shortcut keys -  
Ctrl-Cmd-T

1 Press **Ctrl** + **Alt** + **T**. This will launch the Terminal.<sup>[1]</sup>

# Use Linux commands in the terminal window

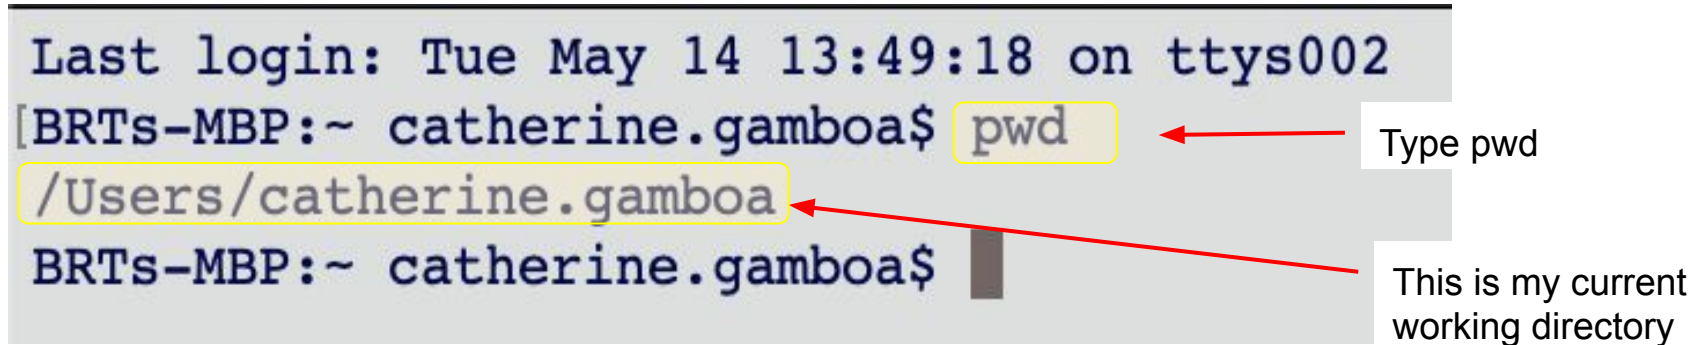

The image shows a terminal window with a dark title bar. The title bar contains the text "Split pane" on the left and a home icon followed by "catherine.gamboa — -bash — 80x24" on the right. The terminal content displays two login messages: "Last login: Fri May 10 13:49:59 on console" and "Last login: Tue May 14 13:49:18 on ttys002". Below the second message is the prompt "BRTs-MBP:~ catherine.gamboa\$" with a cursor. The terminal is overlaid on a desktop background with a dock at the bottom showing a file named "agBRT/gitCourse.ç".

```
Last login: Fri May 10 13:49:59 on console
Last login: Tue May 14 13:49:18 on ttys002
BRTs-MBP:~ catherine.gamboa$
```

# Use the command **pwd** to find where you are in the computer

pwd (print working directory): this command prints the current directory.

```
Last login: Tue May 14 13:49:18 on ttys002
[BRTs-MBP:~ catherine.gamboa$ pwd
/Users/catherine.gamboa
BRTs-MBP:~ catherine.gamboa$
```

The image shows a terminal window with a light gray background. The text is in a monospaced font. The first line is "Last login: Tue May 14 13:49:18 on ttys002". The second line is the prompt "[BRTs-MBP:~ catherine.gamboa\$". The third line shows the command "pwd" being entered, highlighted with a yellow box. A red arrow points from the text "Type pwd" to this box. The fourth line shows the output "/Users/catherine.gamboa", also highlighted with a yellow box. A red arrow points from the text "This is my current working directory" to this line. The fifth line shows the prompt "BRTs-MBP:~ catherine.gamboa\$" with a cursor.

Type pwd

This is my current working directory

# The directory name is part of the Linux prompt

```
Last login: Tue May 14 13:49:18 on ttys002
[BRTs-MBP:~ catherine.gamboa$ pwd
/Users/catherine.gamboa
BRTs-MBP:~ catherine.gamboa$
```

Notice the current directory name is included as part of the Linux prompt

# The ~ (tilda) command signifies your home directory

```
Last login: Tue May 14 13:49:18 on ttys002
[BRTs-MBP:~ catherine.gamboa$ pwd
/Users/catherine.gamboa
BRTs-MBP:~ catherine.gamboa$
```

This means my home directory

# Use the command **cd** to change directories

cd (change directory): is used to change current working directory

For example `cd <directory name>`

Type 'cmd directory name'

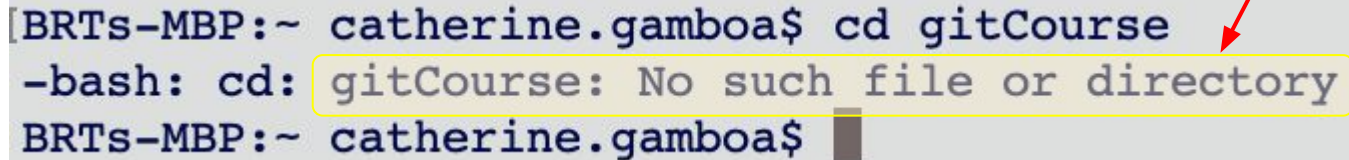

```
[BRTs-MBP:~ catherine.gamboa$ cd gitCourse  
-bash: cd: gitCourse: No such file or directory  
BRTs-MBP:~ catherine.gamboa$
```

# The directory may not exist

The directory does not exist in my home directory

```
[BRTs-MBP:~ catherine.gamboa$ cd gitCourse  
-bash: cd: gitCourse: No such file or directory  
BRTs-MBP:~ catherine.gamboa$
```

A terminal window showing a user attempting to change the directory to 'gitCourse'. The command 'cd gitCourse' is entered, but the system responds with an error: '-bash: cd: gitCourse: No such file or directory'. A red arrow points from the text 'The directory does not exist in my home directory' to the error message. The error message is highlighted with a yellow box.

# The directory may not exist

**Caution:** it is a very common mistake to forget where you created your directory.

If you use 'cd <directory name>' in the wrong directory, you will get this message, even though the directory exists somewhere on your computer.

(use the find command to find the file or directory)

The directory does not exist in my home directory

```
[BRTs-MBP:~ catherine.gamboa$ cd gitCourse  
-bash: cd: gitCourse: No such file or directory  
BRTs-MBP:~ catherine.gamboa$
```

# Create a directory

Step 1: make sure you are in the right directory

**pwd**

Step 2: make the directory using the 'mkdir' command

**mkdir gitCourse**

Make the directory called gitCourse

```
[BRTs-MBP:~ catherine.gamboa$ mkdir gitCourse
```

# List the contents of the current directory to check that gitCourse was created

**ls:** list the contents of the directory

List the contents of the current directory

The directory gitCourse was created

```
[BRTs-MBP:~ catherine.gamboa$ mkdir gitCourse
[BRTs-MBP:~ catherine.gamboa$ ls
Applications      Library           Public
Desktop           Movies            code
Documents         Music             gitCourse
Downloads         Pictures          iCloud Drive (Archive)
BRTs-MBP:~ catherine.gamboa$
```

# Introduction to git

# What is Git?

**Git** is a version control system to keep track of changes to files and projects over time.

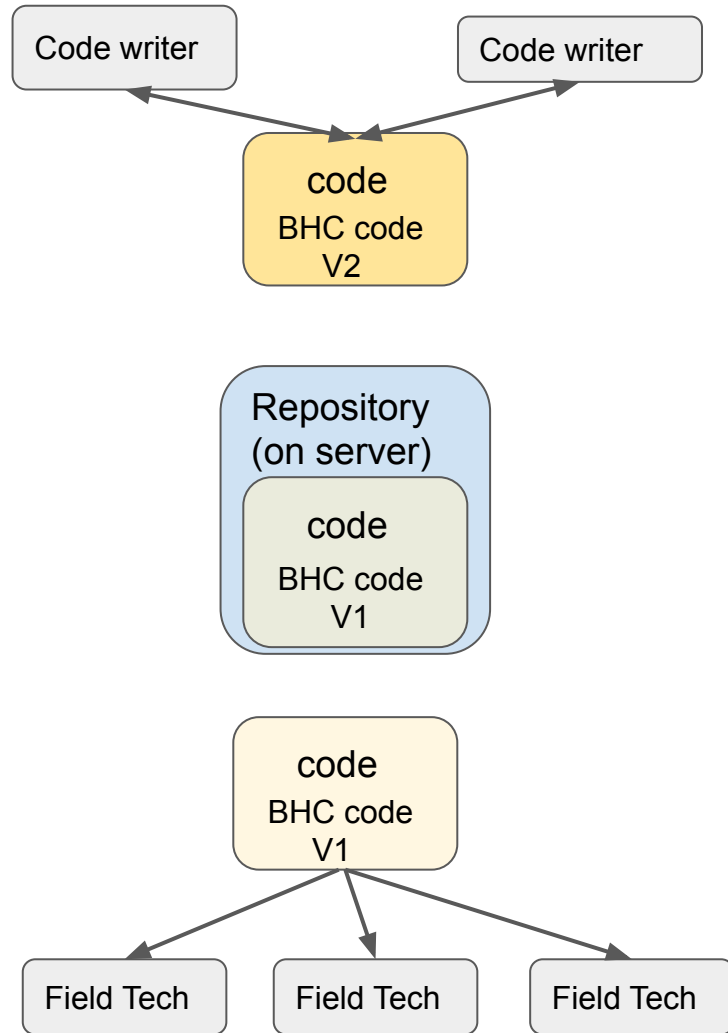

**GitHub** is a website that hosts Git repositories online, making it easier for developers to share code.

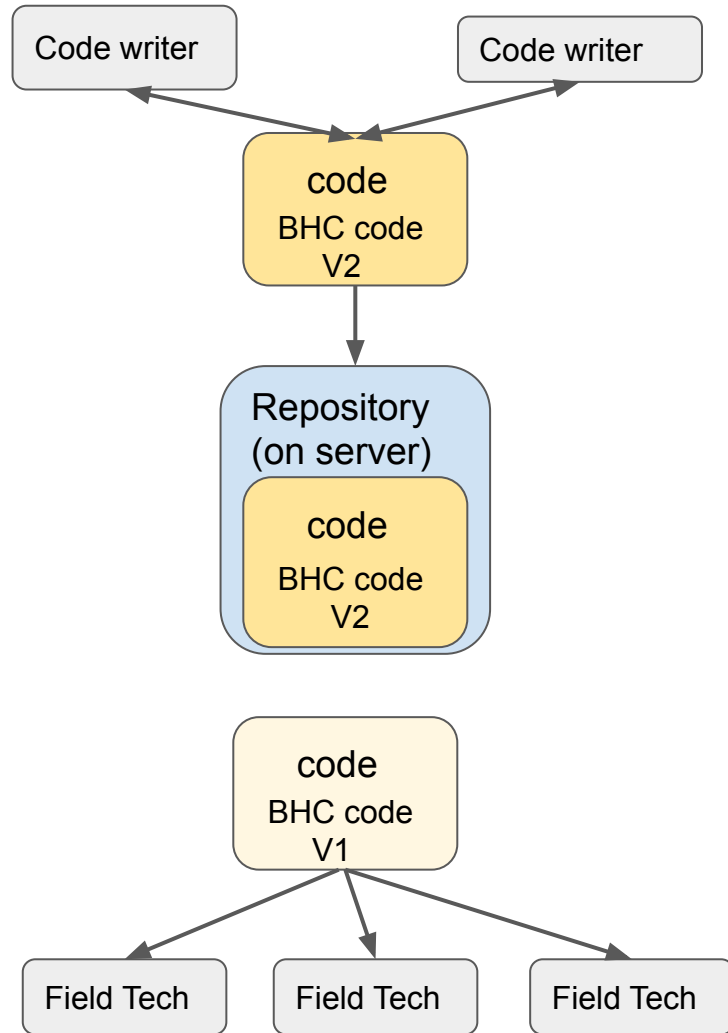

**Repositories** (or "repos") are folders which contain intentional snapshots of progress called commits.

With git you can use a version of the software while Hari and Ramitha modify a copy of the code.

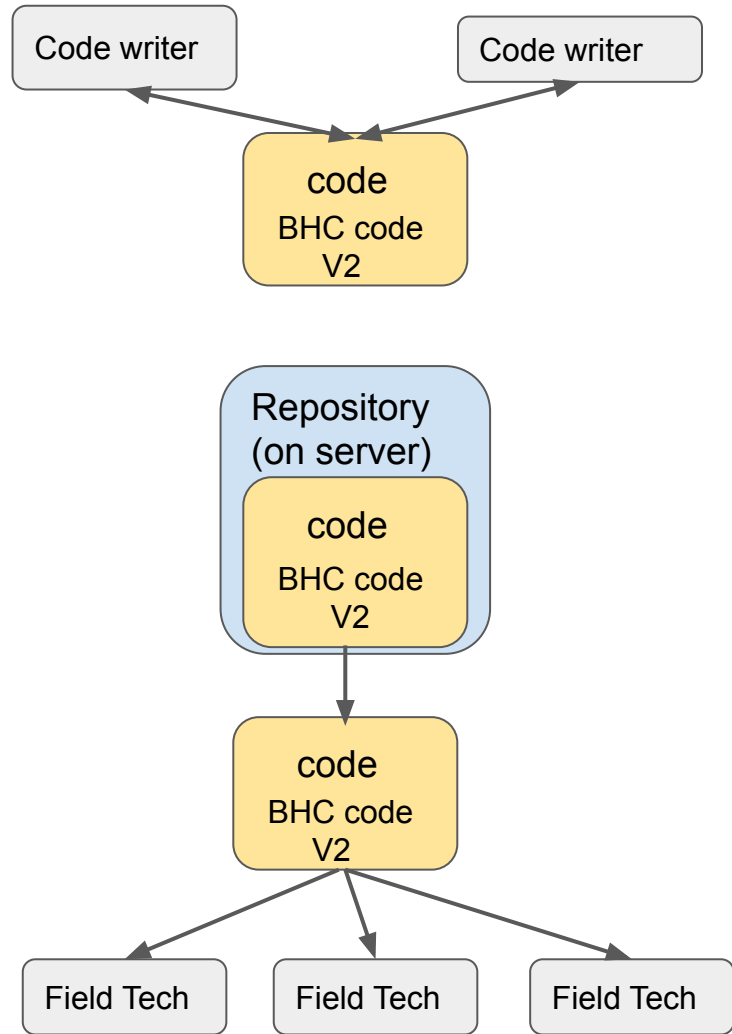

When Ramitha and Hari are ready, they can push their code to the server

Then you can pull  
the code and use it

# Lab

Using git

# Lab: Cloning a git Repository

In this lab you:

Go to the gitHub for the course

# Go to the GitHub for this course

Go to <https://github.com/cagBRT>

# Select the gitCourse repository

# Clone with HTTPS

The image shows a GitHub interface with a 'Clone or download' button. A dropdown menu is open, displaying the 'Clone with HTTPS' option. A red arrow points to the copy icon next to the URL, with the text 'Click here' next to it.

Find File Clone or download ▼

**Clone with HTTPS** ⓘ

Use Git or checkout with SVN using the web URL.

`https://github.com/cagBRT/gitCourse.g` 

Open in Desktop Download ZIP

Click here

# Save the URL

The URL is now copied into your clipboard.

It should look similar to this:

`https://github.com/cagBRT/gitCourse.git`

# Lab

Clone the repository to your directory

# Check the contents of gitCourse

Use **ls** to check that gitCourse is an empty directory.

```
BRTs-MBP:gitCourse catherine.gamboa$ ls gitCourse  
BRTs-MBP:gitCourse catherine.gamboa$
```

If gitCourse is not empty, the next step will give you a fatal error message. You learn how to handle this error soon.

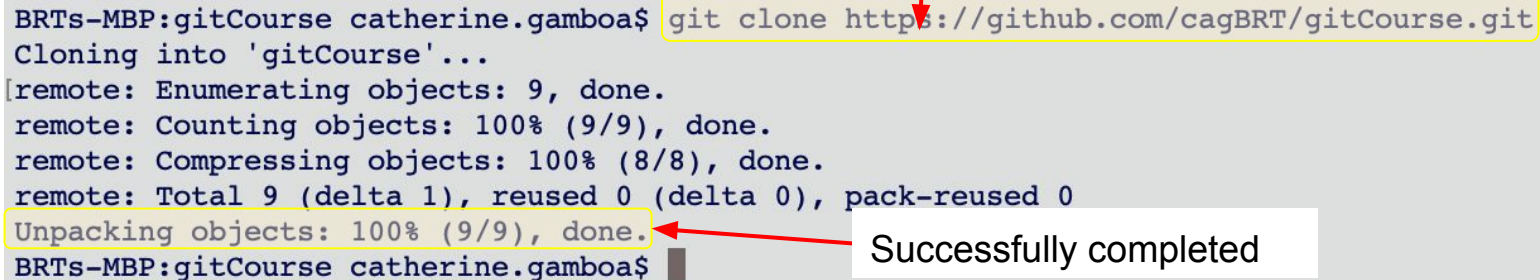

# Use the 'git clone' command to copy the repository to your directory

1. In your terminal window type **git clone <repository URL>**

Paste the repository URL into the terminal after the **git clone** command

2. Then **<return>**

git clone git-repository

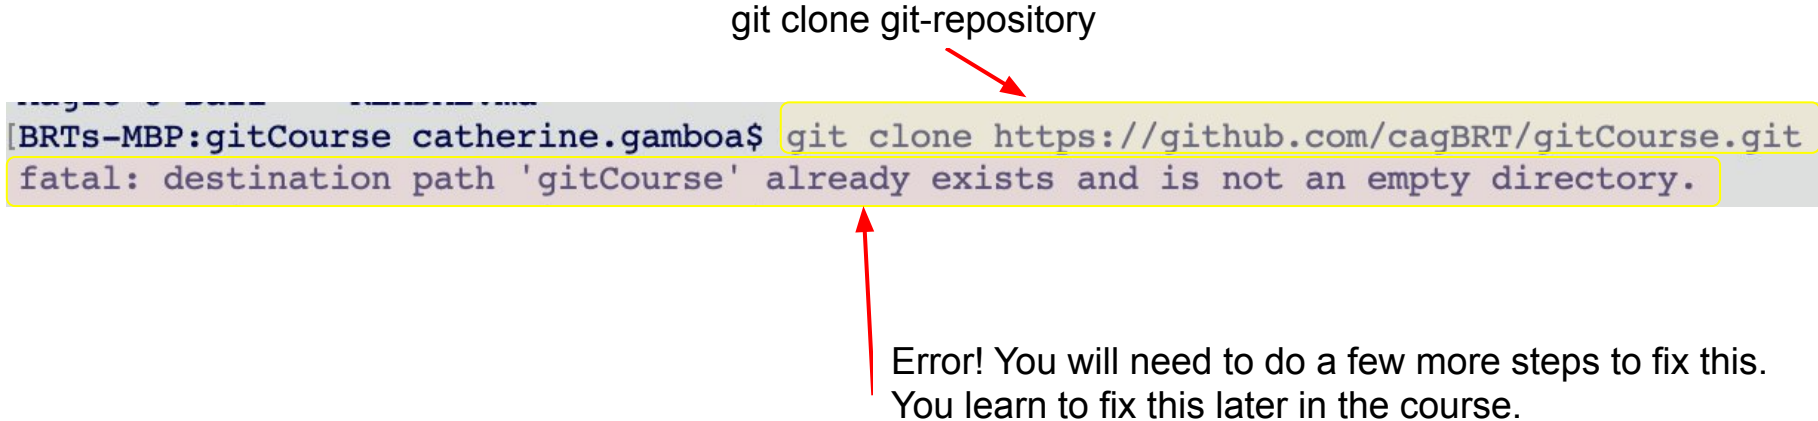

The screenshot shows a terminal window with the following text:   
BRTs-MBP:gitCourse catherine.gamboa\$ git clone https://github.com/cagBRT/gitCourse.git   
Cloning into 'gitCourse'...   
[remote: Enumerating objects: 9, done.   
remote: Counting objects: 100% (9/9), done.   
remote: Compressing objects: 100% (8/8), done.   
remote: Total 9 (delta 1), reused 0 (delta 0), pack-reused 0   
Unpacking objects: 100% (9/9), done.   
BRTs-MBP:gitCourse catherine.gamboa\$   
A red arrow points from the text 'git clone git-repository' to the URL 'https://github.com/cagBRT/gitCourse.git'. Another red arrow points from the text 'Successfully completed' to the line 'Unpacking objects: 100% (9/9), done.'.

```
BRTs-MBP:gitCourse catherine.gamboa$ git clone https://github.com/cagBRT/gitCourse.git
Cloning into 'gitCourse'...
[remote: Enumerating objects: 9, done.
remote: Counting objects: 100% (9/9), done.
remote: Compressing objects: 100% (8/8), done.
remote: Total 9 (delta 1), reused 0 (delta 0), pack-reused 0
Unpacking objects: 100% (9/9), done.
BRTs-MBP:gitCourse catherine.gamboa$
```

Successfully completed

If your directory is not be empty, you will get this error message

git clone git-repository

```
[BRTs-MBP:gitCourse catherine.gamboa$ git clone https://github.com/cagBRT/gitCourse.git  
fatal: destination path 'gitCourse' already exists and is not an empty directory.]
```

Error! You will need to do a few more steps to fix this.  
You learn to fix this later in the course.

# Check that the repository was correctly copied

Use **ls gitCourse** to check the contents of gitCourse

There should be a file called Magic\_8\_Ball.py and one called README.md

```
BRTs-MBP:~ catherine.gamboa$ ls gitCourse  
Magic_8_Ball.py README.md
```

# If your repository copied correctly, you are ready to use the code

1. Go to the gitCourse directory (`cd ~/gitCourse`)
2. `python Magic_8_Ball.py`
3. Ask the magic 8 ball a question and it will give you an answer.

```
BRTs-MBP:gitCourse catherine.gamboa$ python Magic_8_Ball.py
Ask the magic 8 ball a question: (press enter to quit) Will everyone love my course?
My sources say no
Ask the magic 8 ball a question: (press enter to quit) Will everyone love my course?
My sources say no
Ask the magic 8 ball a question: (press enter to quit) Will everyone love my course?
Reply hazy, try again
Ask the magic 8 ball a question: (press enter to quit) Will everyone love my course?
Concentrate and ask again
Ask the magic 8 ball a question: (press enter to quit) Will everyone love my course?
You may rely on it
Ask the magic 8 ball a question: (press enter to quit)
BRTs-MBP:gitCourse catherine.gamboa$
```

Wow! Everyone will love this course!

# Lab

Fatal Error: Directory already exists

# If this happens to you, don't panic, it can be fixed

git clone git-repository

A terminal window screenshot with a light gray background. The prompt is `[BRTs-MBP:gitCourse catherine.gamboa$`. The command `git clone https://github.com/cagBRT/gitCourse.git` is entered and highlighted with a yellow box. Below it, the error message `fatal: destination path 'gitCourse' already exists and is not an empty directory.` is displayed and also highlighted with a yellow box. A red arrow points from the text 'git clone git-repository' above to the command, and another red arrow points from the text 'Error! You will need to do a few more steps to fix this' below to the error message.

```
[BRTs-MBP:gitCourse catherine.gamboa$ git clone https://github.com/cagBRT/gitCourse.git
fatal: destination path 'gitCourse' already exists and is not an empty directory.
```

Error! You will need to do a few more steps to fix this

# You will need to do a pull request and get the code again

1. Check which branch you are on: `git branch -a`

```
BRTs-MBP:gitCourse catherine.gamboa$ git branch -a
* master
remotes/origin/HEAD -> origin/master
remotes/origin/cagBRT-patch-1
remotes/origin/master
```

# You will need to do a pull request and get the code

1. Checkout the branch : **git checkout -b origin/master**
2. Check that you are on the right branch: **git branch -a**
3. Check the **git remote -v**

```
BRTs-MBP:gitCourse catherine.gamboa$ git remote -v  
origin  https://github.com/cagBRT/gitCourse.git (fetch)  
origin  https://github.com/cagBRT/gitCourse.git (push)
```

4. Get the new copy of the code: **git pull origin master**

# Lab

Check the status of your code

# Check that your code has not been altered

Check that the code your computer has not been altered: **git status**

```
[BRTs-MBP:gitCourse catherine.gamboa$ git status  
On branch origin/master  
nothing to commit, working tree clean
```

If you see this, you know the code you are using matches the source code on the repository.

# If the code on your local machine has been altered

Check that your code has not been altered: **git status**

```
BRTs-MBP:gitCourse catherine.gamboa$ git status
On branch origin/master
Changes not staged for commit:
  (use "git add <file>..." to update what will be committed)
  (use "git checkout -- <file>..." to discard changes in working directory)

    modified:   Magic_8_Ball.py

no changes added to commit (use "git add" and/or "git commit -a")
```

If you see this, you know the code you are using does not match the source code. You will need to pull a fresh copy of the code (**git pull origin master**)

# Lab

Check that you have the latest version of the code

# Lab: Before using the code, check that you have the latest version of it

Check that code is the latest version: **git remote show origin**

```
BRTs-MBP:gitCourse catherine.gamboa$ git remote show origin
* remote origin
  Fetch URL: https://github.com/cagBRT/gitCourse.git
  Push URL: https://github.com/cagBRT/gitCourse.git
  HEAD branch: master
  Remote branches:
    cagBRT-patch-1 tracked
    master          tracked
  Local branch configured for 'git pull':
    master merges with remote master
  Local ref configured for 'git push':
    master pushes to master (local out of date)
```

Do you not have the latest version of the code

# Lab: Get the newest version of the code

Get the newest version of the code: **git pull origin master**

```
[BRTs-MBP:gitCourse catherine.gamboa$ git pull origin master
From https://github.com/cagBRT/gitCourse
* branch          master      -> FETCH_HEAD
Updating 749a253..e2c64bc
Fast-forward
 Magic_8_Ball.py | 9 ++++++---
1 file changed, 6 insertions(+), 3 deletions(-)
```

# You are ready to use the code

1. Go to the gitCourse directory (cd ~/gitCourse)
2. python Magic\_8\_Ball.py
3. Ask the magic 8 ball a question and it will give you an answer.

```
BRTs-MBP:gitCourse catherine.gamboa$ python Magic_8_Ball.py
Ask the magic 8 ball a question: (press enter to quit) Will everyone love my course?
My sources say no
Ask the magic 8 ball a question: (press enter to quit) Will everyone love my course?
My sources say no
Ask the magic 8 ball a question: (press enter to quit) Will everyone love my course?
Reply hazy, try again
Ask the magic 8 ball a question: (press enter to quit) Will everyone love my course?
Concentrate and ask again
Ask the magic 8 ball a question: (press enter to quit) Will everyone love my course?
You may rely on it
Ask the magic 8 ball a question: (press enter to quit)
BRTs-MBP:gitCourse catherine.gamboa$
```

Wow! Everyone will love this course!
